To:

∰STIC-Biotech/ChemLib

Subject:

09/971,773

With regard to Application No. 09/971,773, please run the following sequence searches:

Search for SEQ ID NOS: 1, 2, 23 and 24, with results of 80% or greater sequence homology

Also, search these same sequences allowing for at least 1 insertion, deletion, substitution, or addition

Thanks!

Robert M. Kelly, Ph.D. Room.2C55, Remsen Bldg. (571) 272-0729

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cells producing antibody compositions including antibody fragments and tusion proteins with Fc domain of antibody, useful for prevention or treatment of cancer, immune diseases, circulatory diseases and infections - Claim 13; Page 1-3; 314pp; Japanese.

Claim 13; Page 1-3; 314pp; Japanese.

This invention relates to novel method for antibody production comprising a Chinese hamster ovarian tissue-originated (CHO) cell transferred with a gene encoding an antibody molecule for producing a composition comprising an antibody molecule with an Fc domain bonded to the V-glycoside linkage complex sugar chain. The produced antibody compositions are drugs for prevention or treatment of diseases, circulatory diseases, and viral and bacterial infections. The antibodies can be stably produced using the method of the invention with high binding activity and potency thus leading to high safety and aruges for therapy. The present sequence represents a nucleotide molecule used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is affiliated with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;

(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;

(e) selecting a composition for inhibiting prostate cancer in a patient;

(f) assessing the prostate cell carcinogenic potential of a compound;

(f) assessing the aggressiveness or indolence of prostate cancer in a patient;

(h) assessing the aggressiveness or indolence of prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel method for antibody production comprising a Chinese hamster ovarian tissue-originated (CHO) cell transferred with a gene encoding an antibody molecule for producing a composition comprising an antibody molecule with an Fc domain bonded to the N-glycoside linkage complex sugar chain. The produced antibody compositions are drugs for prevention or treatment of diseases accompositions are drugs for prevention or treatment of diseases, circulatory diseases, and viral and bacterial infections. The antibodies can be stably produced using the method of the invention with high binding activity and potency thus leading to high safety and reduced side effects when applied alone or in combination with other molecule used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens are collectively and cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and treatment of diseases associated with inappropriate P capression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell or express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinoms and cancers. AAH37196 to AAH37204 and AAB37799 represent sequences used in the exemplification of the
